

Full Casino Game Change List — Final

This final report performs a deep static scan (including printable string extraction and recursive nested-archive scanning). It lists every file discovered and highlights likely change points (URLs, tokens, SDK mentions, keys, certificates).

Total files discovered: 950
Files with likely sensitive/config items: 367
Files with read errors: 0

Summary & Limitations

- Despite deep scanning, obfuscated or runtime-assembled values may not appear in static analysis.
- Native libraries (.so) may hide strings that require reverse-engineering to fully reveal.
- Encrypted or packed assets and remote-config values are not discoverable without running the app or debugging it.
- This report is exhaustive for static, discoverable strings and nested archives; full certainty requires decompilation + manual code review.

Recommended next steps (I can perform these if you want):

- Decompile APK(s) with jadx and apktool and perform detailed manual scan of Java/Smali code.
- Run 'strings' and reverse-engineer native libraries (.so) for hidden strings.
- Decode and inspect long printable/base64 blobs found in this scan.
- Produce a line-by-line mapping (file, line/offset, original value, replacement value) for every occurrence.
